Description

As concrete cures & begins to set, it will develop internal stresses that if not relieved will appear in the form of a random crack.

Our Early Entry Green Blades controls random cracking by making the cut at an early stage. The concrete can be cut within the first one or two hours of finishing and before the concrete starts curing.

By utilizing this process you minimizing the risk of random cracking, this route simplifies the working process compared to conventional sawing.

These blades are designed with a patented star arbor that fits most asymmetrical saw arbors (Soff Cut)

This Early Entry Green Blade is 8"X.100X 10MM. & Includes at no extra charge a replacement skid plate.
